

Demo Video & Presentation Guide

Exactly what to record, what to say, and how to present Orient.

Team minahiru · The final-stretch guide · 25 September 2026

By this point you've run Orient in Bob and your `onboarding-pack` is full. This guide covers the last three deliverables: the **demo video**, the **slide deck**, and the **submission**. Do them in that order.

You submit three things: (1) the GitHub repo, (2) a 2–3 minute demo video, (3) the pitch deck + a written description on the lablab form. The video and the impact numbers carry the most weight — judges watch before they read code.

Part 1 — Record the demo video

Length: aim for 2:30–3:00. Shorter and tight beats long and rambling.

How to record on Windows (free)

- **Simplest:** press `Win + G` to open Xbox Game Bar → Capture widget → record the screen. Or press `Win + Alt + R` to start/stop.
- **Better (recommended):** install **OBS Studio** (free) for cleaner screen + mic recording. Set it to record the display and your microphone.
- Record in a quiet room. Speak slowly. You can re-record any section — you don't need one perfect take.
- Close notifications. Zoom your editor font up so text is readable in the video.

The shot list (record these segments, then stitch or do in one take)

TIME	WHAT'S ON SCREEN	PURPOSE
0:00–0:20	You / a title slide. The problem stated.	Hook
0:20–0:50	The messy sample-app. Try the README's steps — it fails.	Show the pain
0:50–1:40	Bob IDE: paste Task 1, then Task 2. The pack files appear.	The solution working
1:40–2:20	Fresh Bob chat uses only the pack to run the app + pass the test.	The proof
2:20–2:50	The impact table with your real numbers.	The payoff
2:50–3:00	One-line close + repo link.	Wrap

Narration script (adapt in your own words)

Hook — *"When a developer joins a project, they lose days before their first real contribution — just figuring out how to run it and what the code actually does. I built Orient, using IBM Bob, to turn those days into minutes."*

The pain — *"Here's a real, messy service. I'll follow its README exactly — run this command... and it fails. The start command is wrong, and even after I fix it, the app crashes on a required setting the docs never mention. This is the normal onboarding experience."*

Orient working — *"Now I point Bob at the same repo. First task: find every setting the code actually needs and write real setup steps. Bob produces a complete environment file and a SETUP guide. Second task: check the README against the code — Bob finds five places the docs are simply wrong, each with the exact file and line."*

The proof — *"The real test: I open a fresh Bob session with no memory of any of this, and give it only the pack Orient generated. Using just that, it gets the app running and completes a starter task — a failing test now passes. A brand-new developer would have succeeded on the first try."*

Impact + close — *"Manually this took me [X] minutes and two blocking errors. With Orient's pack: [Y] minutes, zero. That's Orient — built with IBM Bob. Thank you."*

Record your Bob runs while you do Part 3 of the Playbook, so you capture the real thing once. Don't fake the terminal — judges can tell, and the genuine "it fails, then it works" moment is your strongest asset.

Part 2 — The slide deck

Your deck is ready: `Documents\Orient-Pitch-Deck.pdf` (10 slides, 16:9). Use it two ways — as the visuals you talk over, and as the file you attach to the submission. Below is what each slide is for and what to say. Keep each slide to ~20–30 seconds if you present live.

#	SLIDE	SAY THIS
1	Title	Name, team, one-line pitch.
2	The problem	Onboarding wastes days on archaeology, and it repeats per hire.
3	The idea	Orient in one sentence: messy repo in, verified pack out.
4	How it works	Three focused agents; each a Bob subagent.
5	Built with Bob	Map to judging: Agent mode, subagents, skills, document understanding.
6	Demo	Before vs after — drop in your two screenshots here.
7	The proof	Fresh agent succeeds using only the pack.
8	Impact	Your real before/after numbers.
9	Limits & next	Honest boundaries + the MCP / per-PR future.
10	Close	Thank you + repo link.

Two edits to make the deck yours: on slide 6 replace the dashed placeholders with your two screenshots (before-fails, after-pack), and on slide 8 type in your real numbers from `MANUAL - BASELINE.md`. If you want those changes made in the file itself, tell Claude and it'll regenerate the deck with them baked in.

Part 3 — Submit on lablab

1. Push the whole `orient-hackathon` folder to GitHub (GitHub Desktop → Publish). Confirm `bob_sessions/` with your screenshots is included.
2. Upload the video (YouTube unlisted, or the platform's uploader) and copy the link.
3. On the lablab submission form: title (**Orient**), the written description (reuse the top-level README), the GitHub link, the video link, and attach the deck PDF.
4. Submit **before** the deadline, not in the final hour — uploads and forms fail at the worst time.

Final checklist

DONE?	ITEM
☐	Demo video recorded, 2–3 min, shows fail → Orient → proof → numbers
☐	Video uploaded, link ready
☐	Deck: screenshots on slide 6, real numbers on slide 8
☐	bob_sessions/ has all task-summary screenshots
☐	Impact numbers filled in README + MANUAL-BASELINE
☐	Repo pushed to GitHub, bob_sessions included
☐	lablab form submitted with repo + video + deck

The whole submission is now: a real repo (built), a demo you record in one honest sitting, a deck (built), and numbers you measure. Nothing here is abstract anymore.
